

## Video Inspection system V7000

The main advantage of this system is the easy handling and the great focalisation range. The concept is to build a system for fast inspection of workpieces with different magnifications via a makro Zoom objective. During the inspection, the operator chooses his desired magnification by turning the ring on the objective. No height adjustment is needed! With the cold light source with slot-ringlight and a USB camera full screen images on a 20" screen are possible. In combination with a PC memorisation and full documentation is possible.
